Common need

- 1) Get a set of data (as an array)
- 2) Do something with it and generate a new set of data (as an array)
- 3) Do something with the result

The Nexus (Pulling v. Pushing)

Live arrays tie this all together
by incorporating *extensible logic* into data.

XML attributes can be expressed as
symbolic variables

Live array structure
reflects the output

Types of live arrays:

- Data as key:value pairs
- Evaluable key:value pairs (possibly mixed with static data.)
